Category Pallet truck  
Relates to instruction  
video no. C3, D1

An electric scissor pallet truck is a pallet truck with a battery powered lever for raising and lowering the forks. It can be used when emptying and packing pallets manually, for example in connection with receipt, processing and delivery of goods. It can also be used to ensure a proper working height when scanning, packing and labelling products, for example.

## Benefits

- An electric scissor lift allows for quick and easy adjustment of the working height to the relevant person or task
- The height can be easily adjusted to the relevant shelf, so that products can be slid instead of lifted from pallet to shelf or from shelf to pallet
- The pallet truck is mobile and can be used in the shop area as well as in the stockroom

## Requirements for use

- The electric scissor pallet truck should be suited for the product and task at hand, for example with regard to lifting capacity and lifting range
- There should be room to move and manoeuvre the pallet truck
- The surface of transport routes should be even, stable, level and without holes, and the route should be well lit
- The pallet load should be stacked so that it is stable and the weight and height of the pallet should conform with the technical specifications of the pallet truck
- There should be a charging point for charging the electric scissor pallet truck
- Users of electric scissor pallet trucks must be over 18

## Considerations prior to procurement

- What do we need an electric scissor pallet truck for?
- What are our requirements for lifting capacity and lifting range?
- Do we have special requirements for manoeuvrability, for example with regard to floor surface and handling fragile goods?
- Where can we charge the electric scissor pallet truck?
- There may be special requirements for the location of a charger station due to risks of flammable gas emissions - if in doubt, ask the fire authorities

- Make sure the instructions are followed
